About

If you change the original script.js in the plug-in **dokuwiki-plugin-imagemap**, you can add clickable markers on images. This may be very useful for maps.

A word to the author of dokuwiki-plugin-imagemap, Gerry Weißbach: Feel free to merge this code with your project. Other parts of your software are unchanged. I repaired the window.resize handler, in case your viewport grows.

Used plug-in: **wrap**

How to use?

Add to the mappings (areas) an unique identifier. Unique in the sense, that only their lower case form are used. This is the **first word** in the title of the mapping.

E.g. `[[imagemapping:start|CP01 Seneca Village @ 329,132,30]]` The identifier is: `CP01` or technically: `cp01`. The coordinates (here) `329,132` are from the original image.

You now may add spans (references) with the CSS-class `wrap_imaploc` and with the ID set to the identifier. I've used the plug-in **wrap** to perform this.

Reference wiki code (with wrap): `<wrap imaploc #CP01>Seneca Village</wrap>` / Resulting HTML-Code: `<span class="wrap_imaploc" id="cp01">Seneca Village</span>`

You may use multiple references for the same identifyer. You can place references at anyplace in the page. There is no rule to place them right behind the image mapping.

In case you click the reference, a marker is shown at the given point. Works with all three forms of mapping: circle, rectangle and polygon.
